Data Driven Methods For Fault
The main objective of Data-Driven and Model-Based Methods for Fault Detection and Diagnosis is to develop techniques that improve the quality of fault detection and then utilize these developed techniques to enhance monitoring various chemical and environmental processes. The book provides both the theoretical framework and technical solutions.

Data-driven methods provide a convenient alternative to these problems. In data-driven approach, we use operational data of the machine to design algorithms that are then used for fault diagnosis and prognosis. The operational data may be vibration data, thermal imaging data, acoustic emission data, or something else.

Data-Driven Machinery Fault Diagnosis | Biswajit Sahoo
This paper provides a comparison study on the basic data-driven methods for process monitoring and fault diagnosis (PM–FD). Based on the review of these methods and their recent developments, the original ideas, implementation conditions, off-line design and on-line computation algorithms as well as computation complexity are discussed in detail.

For data-driven approaches, fault diagnosis can be considered as a two stages procedure that encompasses (1) fault detection and (2) classification. The first stage aims at detecting whether the system behavior matches with the expected one while the second stage concerns the determination of the class (type) of fault.
